

Your numbers, run honestly. Floor, thesis, and the bar.

This is your cut of the same scenario model the founders ran on themselves: three outcomes, the receipts behind each number, and exactly what fundraising does and does not touch. Nothing here is a promise. It is a map, so the decision you make about the next five years runs on real math.

\$160–235K

this year's OTE at quota and stretch, uncapped past it, every year, in cash

~\$4M

the floor: we hit \$6M of revenue but never earn the platform multiple

~\$7M

the thesis: same revenue, margin at ~65%, product at half the mix

\$18–23M

the bar: Haven/Delightree pace, ~\$19M revenue by 2029

Three engines: one pays now, one is dilution-proof, one is back-weighted for the big year.

HOLDING	TERMS, IN ONE LINE
Cash · OTE + uncapped	\$80K base + 8% of activated Net New ARR, 15% uncapped past quota. \$160K at quota, \$235K at stretch, no ceiling, plus the 5% bookkeeping channel bonus behind every brand you source.
5% → 14% · umbrella	5% granted at signing; rungs at \$2.0M / \$3M / \$6M company gates with your personal keys. This half never dilutes, no matter how much the product company raises.
0% → 5% · Rollup	Six tranches on cumulative activated ARR, back-weighted: the \$6M and \$10M tranches are worth six times the first two. This half rides the product company's upside, including through a raise.

The scenario values below assume the ladders are fully earned (14% + 5%). That is the honest fine print: these are the outcomes of the work succeeding, not of time passing. Every number keys to the same December-31-style gates the founders' ladders key to.

Moving left to right is the entire strategy.

SCENARIO	WHAT HAS TO BE TRUE	YOUR POSITION
A · The floor	We reach \$6M of revenue, but the platform multiple is never earned: services trades like a services business, product like a small product business. A ~\$51M company.	~\$4M + every commission check along the way
B · The thesis	Same \$6M of revenue, but margin reaches ~65% and product is half the mix, so the blended platform multiple (12–18x) is earned. A ~\$90M company.	~\$7M (range \$6–9M) + commissions
C · The bar	Haven/Delightree speed applied to our base: ~\$19M of revenue by 2029, platform multiple held. A ~\$230–285M company.	~\$18–23M + years of accelerator commissions

Margin and mix move us from A to B. Speed moves us from B to C. Your seat is the speed lever: the logos, the pipeline, the activation number. Which is the whole argument for why your equity concentrates where it does.

Where each number comes from, layer by layer.

Entity values flow up the stack: arms → umbrella → Rollup. Your total is your umbrella stake plus your Rollup stake, no layer counted twice, and every scenario sum-checks across all holders to the full company value.

A · floor: 14% × \$12.7M umbrella incentive value	\$1.8M
---	--------

A · floor: 5% × \$36.5M Rollup value	\$1.8M
--------------------------------------	--------

A · your floor total	~\$3.6M, call it ~\$4M with commissions
----------------------	---

B · thesis: 14% × \$31.9M umbrella incentive value	\$4.5M
--	--------

B · thesis: 5% × \$53.7M Rollup value	\$2.7M
---------------------------------------	--------

B · your thesis total	~\$7M
-----------------------	-------

Scenario C applies the same two stakes to a ~\$230–285M company (assumptions: revenue roughly half product, multiple lines live under the umbrella, 12–15× at ~65% blended margin). The range in every scenario reflects the multiple band, not hidden levers.

Dilution touches Rollup. It never touches the umbrella.

Raises happen at Rollup, the product company. Modeled here as standard-shaped rounds (~10% then a second round), not commitments:

YOUR STAKES	BOOTSTRAPPED	AFTER ONE ROUND	AFTER TWO ROUNDS
Rollup (fully earned)	5%	~4.5%	~3.7%
Umbrella (fully earned)	14%	14%	14%

YOUR OUTCOME	BOOTSTRAPPED	ONE ROUND	TWO ROUNDS	WHAT DILUTION ACTUALLY COSTS YOU
B · the thesis	~\$7M	~\$7M	~\$6M	~\$0.8M
C · the bar	~\$20M	~\$19M	~\$17M	~\$3M

For comparison: two rounds cost Taylor and Kayden roughly a quarter of their Rollup-side paper value each (~\$6M at the thesis). Your exposure is deliberately the most protected of the four seats after Jared's, because most of your ladder sits in the umbrella. And the only reason a raise ever happens is if the capital moves us off the floor trajectory and toward the bar, in which case the column you land in matters far more than the dilution inside it.

The worst case is a market OTE. The equity is on top, never instead.

YEAR	CASH
2026	\$160K at quota, \$235K at stretch, uncapped past it, plus ~\$50–100K of bookkeeping channel bonus flowing behind twenty sourced logos over the following year
2027 onward	OTE grows with quota into \$300K+ years as the number scales; base steps toward the funded revenue-leader band (\$120–180K) at the raise
Every scenario	The commissions are real cash in every column above, floor included. The scenarios are what stacks on top of a paid sales career, not a bet against one.

Assumptions, so nothing is hidden: services 4–8× revenue, product 10–15×, blended platform 12–18× only at ~65% gross margin. Illustrative and sum-checked, not a valuation or a promise. Instruments, vesting mechanics, and leaver terms ratify with counsel alongside everyone else's.
